

Made my kids an Air driven Gravel Vac for their small tanks

Vacuuming a small tank is a mission as you run out of water way before you are finished vacuuming the gravel

Having your kids vacuum their own tanks with a siphon type gravel vacwell they only shout for help once there is no water left!

How does it work?

It uses the air rising in the pipe to lift the water in the tube / pipe to a higher point than that of the existing water surface

In Laymen's terms the air bubbles act as pneumatic pistons

This will then suck debris from the bottom and all you have to do is catch it at the top

Hope the photos tell the story

Enjoy!

- 1x piece clear hose
- Standard air pipe
- 1x 90 degree bend
- A few cable ties
- T-piece
- Top portion of a plastic cold drink bottle
- Use your tanks air pump
